Flow of Coolant in the Lincoln Navigator Cooling System

Understanding the coolant flow is crucial for interpreting the Lincoln Navigator cooling system diagram. The typical flow process includes:

- Coolant Circulation from the Water Pump

The water pump pushes coolant from the engine block into the radiator via the upper radiator hose.

- Heat Dissipation in the Radiator

As coolant passes through the radiator, heat is transferred to the radiator fins and air passing through, cooling the fluid.

- Return to the Engine

Cooled coolant exits the radiator through the lower radiator hose and re-enters the engine block.

- Thermostat Regulation

The thermostat determines when the coolant begins circulating through the radiator based on engine temperature, opening once the engine reaches a specified temperature.

- Expansion Tank Role

As the coolant heats, it expands and flows into the expansion tank, preventing pressure buildup. When cooled, the coolant is drawn back into the system.

- Cooling Fan Activation

When engine temperature exceeds a threshold, sensors trigger the cooling fans to increase airflow through the radiator.
