Review Past Quizzes and Tests

Identify common question formats and frequently tested concepts:

- Revisit mistakes to avoid repeating them.
- Focus on weak areas identified from previous assessments.

Sample Practice Problems and Solutions

Problem 1: Finding an Inscribed Angle

Given a circle with center O and points A, B, C on the circle, where $\angle ABC$ is inscribed and subtends arc AC . If the measure of arc AC is 80° , what is the measure of $\angle ABC$?

Solution

According to the inscribed angle theorem, the measure of an inscribed angle is half the measure of its intercepted arc:

- $\angle ABC = \frac{1}{2} \times \text{measure of arc } AC$
- $\angle ABC = \frac{1}{2} \times 80^\circ = 40^\circ$

Problem 2: Calculating the Length of an Arc

In a circle with radius 10 units, the central angle measuring 60° , what is the length of the corresponding arc?

Solution

Using the formula for arc length $(L = r \theta)$, where θ is in radians:

- Convert $\theta = 60^\circ$ to radians: $\theta = \frac{\pi}{3}$ radians.
- Calculate: $L = 10 \times \frac{\pi}{3} = \frac{10\pi}{3}$ units.

Problem 3: Tangent Segment Length

A circle has a radius of 7 units. A point outside the circle is 25 units from the center. Find the length of the tangent segment from this point to the circle.

Solution

- Use the right triangle formed by the radius, the tangent segment, and the line from the external point to the circle's center.
- Apply the Pythagorean theorem: $(\text{tangent length})^2 = (\text{external point distance})^2 - (\text{radius})^2$
- Calculate: $t^2 = 25^2 - 7^2 = 625 - 49 = 576$
- Thus, $t = \sqrt{576} = 24$ units.
